

Software Requirements Specification (SRS)

Project Title

3D Print Sales Tracker

Project Overview

The 3D Print Sales Tracker is a web application designed to help small business owners keep track of their sales in a simple and organized way. The idea for this project came from my own experience running a small 3D printing business. I previously tracked sales using Google Forms and spreadsheets, but the process became time-consuming and difficult to manage as more sales were recorded.

This application is intended to make sales tracking faster and easier by allowing users to enter sales through a mobile-friendly interface, view revenue data, and customize the sales form to fit their business needs.

Purpose

The purpose of this project is to create a tool that helps small business owners record and organize sales without relying on multiple spreadsheets or forms. The application focuses on making data entry quick and easy while still providing useful information about revenue and product performance.

Functional Requirements

Navigation

The system will provide navigation between the following pages:

- Home
- Sales
- Revenue
- Settings

Sales Page

The Sales page will allow users to record a sale by completing a step-by-step process.

Users will be able to:

- Select one or more products sold in an order.
- Assign quantities to each product using on-screen controls.
- Assign colors to each individual print sold.
- Enter the total purchase amount for the order.
- Select where the customer found the product.
- Save the sale to the system.

Product Selection

Products are displayed as selectable cards instead of a traditional dropdown menu.

The system will:

- Allow multiple products to be selected.
- Allow users to increase or decrease quantities for each product.
- Support product images in future versions.

Color Selection

The system automatically creates color selections based on the products chosen.

For example, if a customer purchases two Butterfly Knives, the system will generate:

- Butterfly Knife #1 Color
- Butterfly Knife #2 Color

This allows each print in an order to have its own color assignment.

Revenue Page

The Revenue page will display information about recorded sales, including:

- Total revenue earned
- Sales history
- Date and time of sales
- Product performance information

Additional reporting features may be added later.

Settings Page

The Settings page allows users to customize the sales form.

Users can:

- Edit question text
- Add new answer choices
- Remove answer choices
- Modify existing answer choices

Future versions may allow users to create entirely new questions and upload product images.

Data Storage

The application currently stores data using browser localStorage.

The system will:

- Save sales automatically
 - Save custom form settings automatically
 - Restore saved information when the application is reopened
-

Non-Functional Requirements

Performance

- The application should load quickly.
- Sales should save immediately after submission.

Usability

- The application should be easy to use on both desktop and mobile devices.
- Buttons and controls should be large enough for touch screens.
- Users should be able to record sales with minimal typing.

Reliability

- Sales data should remain available after page refreshes.
 - Saved settings should remain available between sessions.
-

Future Improvements

Some features planned for future development include:

- User accounts and login functionality
 - Cloud database storage
 - Product image uploads
 - Custom question creation
 - Revenue charts and graphs
 - Inventory tracking
 - Expense tracking
 - Profit calculations
 - CSV and Excel exports
 - Etsy integration
 - Multi-user support
-

Changelog

Original Project Idea

- Planned as a Windows Forms desktop application.
- Included basic sales tracking features.

Web Application Conversion

- Switched from Windows Forms to a web-based application using HTML, CSS, and JavaScript.
- Added a navigation system.
- Added Home, Sales, Revenue, and Settings pages.
- Added local storage support for saving data.

Form Customization Update

- Added dynamic form generation.
- Added editable questions and answer choices.
- Added a dedicated Settings page for customization.

Current Progress

- Added multi-select product cards.
- Added quantity controls directly on product cards.

- Added animated quantity selectors.
- Added color assignments for individual prints.
- Added dynamic color questions based on selected products.
- Replaced product dropdown menus with a card-based selection system.
- Added a keypad for entering total purchase amounts.
- Improved the overall user interface and mobile usability.
- Updated revenue tracking to use total order value instead of individual item pricing.
