

Deliverables:

This week you are continuing to develop your project but with one major change. I would like you to get the application into the hands of another person (preferably the intended audience, but classmates or family are fine). During this testing session try to do the following:

- Avoid leading the user. Let them experience the solution in a pure form.
- Observe and record the parts the user stumbles or has issues with.
- If you find yourself wanting to guide them, right it down before giving any hints.
- Record any bugs the user encounters.
- At the end of the test, have the user answer some basic questions about the application. Some example questions are:

1. How well did this solve the problem?

It will be fabulous for shows and tracking sales.

2. What was difficult to understand?

The only hiccup I encountered was that the total did not auto populate, but that makes sense as you may be selling it for different amounts at different events. Very intuitive, just took my brain a minute to catch up with intent.

3. What worked well for you?

Everything! It is functioning great and will be useful for the intended purpose as well as tracking inventory and colors.

4. What features would you like to see in the application?

Add product images and possibly enter custom request form.

5. If you could change anything about the app, what would it be?

Maybe add expense tracking and a separate log to capture whether events were good, capture the event specifics so you can come back next year to prep.
